Define Problem Statements

Date	**4 March 2026**
Team ID	**SWTID-2026-8059**
Project Name	**Automating Data Import and Relationship Mapping Using Import Sets & Dot Walking**
Maximum Marks	**4 Marks**

Problem Statement(Definition):

In many organizations, employee information is maintained in external systems such as HR applications or spreadsheets. These systems regularly generate data files containing employee details like **Name, Email, Department, and Manager**. Manually entering or updating this information in **servicenow** is time-consuming, inefficient, and prone to human errors.

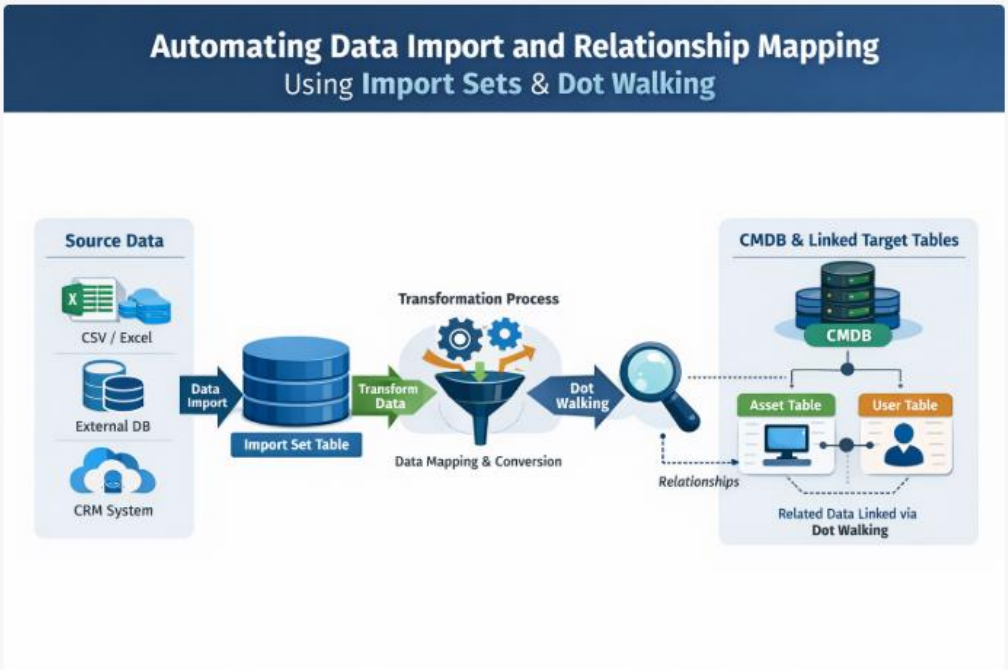
Additionally, during the incident management process, when an **incident is assigned to an employee**, it is often necessary to identify and contact the **manager of the employee's department** for communication or escalation. Without an automated mechanism, users must manually search through multiple records to find the manager's email, which slows down the workflow and reduces efficiency.

The Problem: Data Incompatibility

Organizations often need to move data from external sources (like Excel, legacy databases, or third-party tools) into servicenow. The "problem" is that external data is rarely formatted exactly like servicenow's internal tables. Moving it directly could result in:

- **Data Corruption** : Overwriting critical system fields.
- **Performance Issues:** Slowing down production tables during large uploads.
- **Formatting Errors** : Date formats or choice lists not matching.

Problem & Solution Table

Problem	Description	Solution
Employee Data Entry	Employee details such as Name, Email, Department, and Manager are stored in external systems like Excel or HR databases. Manually entering this data into the system is time-consuming and may lead to errors.	Use ServiceNow **Import Sets** to **automatically import** employe-data from external files such as CSV or **Excel** into the system.
Data Integration Issue	The system does not automatically integrate external employee data with the ServiceNow User table, which le-ads to incomplete or outdated information.	Use **Transform Maps** to map fields from the **Import Set table** to the **User Table** so that emplo-yee information is correctly store.
Relationship Management	Relationships between employees, departments, and managers are not clearly maintained, making it difficult to access related information.	Create **reference relationships** between the **User table**, **Departme** nt table, and **Manager** field
Manager Contact Visibility	When an Incident is assigned to an employee, the system does not automatically display the manager's email for escalation or communication.	Use **Dot Walking** (e.g., assigned_to. **department.manager.email**) to automatically retrieve and display the manager's email on the Incident form.
Manual Communication Delay	Support teams may waste time searching for the correct manager contact details during incident resolution.	Automate the process so that manager details appear instantly, improving communication, and incident handling efficiency.


Process of Automatic Data Import:
